

BUG REPORT

Bug ID

BUG-001

Bug Title

Location Coordinates Exposed Through Client-Accessible Network Response

Project Name

Game Intelligence Leak Testing – GeoGuessr

Reported By

Bharath Roy

Severity

High

Priority

High

Status

Open

Environment

- Application: GeoGuessr
- Browser: Google Chrome
- Testing Type: Exploratory Testing
- Tool Used: Chrome DevTools

Description

During exploratory testing, answer-related location coordinates were found exposed within client-accessible network responses.

The exposed latitude and longitude values could be copied and searched using external mapping tools such as Google Maps to identify the exact game location before submitting a guess.

This behavior may provide an unfair gameplay advantage and impact the integrity of the game.

Preconditions

- GeoGuessr game round is active.
- Browser Developer Tools are available.

Steps to Reproduce

1. Open GeoGuessr web application.
2. Start a new game round.
3. Open Chrome Developer Tools (F12).
4. Navigate to the Network tab.
5. Monitor Fetch/XHR requests.
6. Inspect network response data.
7. Locate latitude and longitude values.
8. Copy the coordinates.
9. Search the coordinates using Google Maps.

Expected Result

The application should not expose exact answer-related location coordinates before the player submits a guess.

Actual Result

Exact latitude and longitude values are visible within client-accessible network responses and can be used to determine the correct location externally.

Impact Analysis

Business Impact

- Reduces gameplay fairness.
- Enables potential cheating.
- Affects leaderboard integrity.
- Impacts overall user trust.

User Impact

- Technical users gain unfair advantage.
- Normal users compete at a disadvantage.

Risk Level

High

Evidence

Video Evidence

- Screen_Recording.mp4

Recommendation

Avoid exposing exact location coordinates in client-side responses before guess submission.

Only essential gameplay information should be transmitted to the client during an active game session.

Conclusion

A High Severity gameplay intelligence leak was identified through exploratory testing. The issue allows answer-related location information to be accessed before gameplay completion and should be reviewed to maintain game integrity.
